**Robert G. Williams : Export Agriculture and the Crisis in Central America** before purchasing it in order to gauge whether or not it would be worth my time, and all praised Export Agriculture and the Crisis in Central America:

3 of 3 people found the following review helpful. The environmental repercussions of export agricultureBy Carlos AlmendarezWilliams' book deals with the issue of export agriculture in Central America and its repercussions on the economic, ecological, and social well-being of this troubled region. Williams divides the book into three parts, according to the main exports of Latin America. First, Williams deals with cotton's emergence as a cash crop and its positive and negative aspects. Second, Williams deals with cattle and the effects it has had upon the land and the men who till it. This book is interesting in the way it views the cash crops in an economic light and in the ways they affect

farmers, largefarmers, and the working class. The environment has blessed Central America with some of the best land anywhere on earth. Central America's pacific coastal plain, for example, is ideal for growing cotton. The ecological consequences of growing cotton, however, are quite severe. The stress on the soil is severe, considering this crop is not for subsistence. While the law requires that the land be cleared as to protect the land, it is nearly inevitable to prevent the volcanic soils to be vulnerable from wind and water erosion. In the rainy season, however, thunderstorms take their toll on the soil since they make the land prone to flooding. This damage is in addition to the fact that the best lands are used for the production of cotton, while simultaneously polluting the coastal eco-system. The fertility of the soil was short lived in Central America, since after four or five years of consecutive cultivation the light soils of the coastal plain began to lose their natural fertility. This, in turn, led to the need to use chemicals to yield more crops per acre of land. In regards to cattle, Williams argues that the emerging demand for beef in the United States as a result of the fast food business precipitated the need to make subsistence plots in Latin America land for cattle grazing. For institutions like the World Bank, AID and IADB cattle was seen as a pragmatic, quick way to achieve export led growth. By most accounts, this land was carved from Central American forests. Swidden agriculture (slash and burn) practiced by indigenous allowed for the land to be regenerated after the patch had been abandoned. Under modern methods of forest clearing, the land is almost always relegated to remaining fallow. Modern methods of clearing have allowed for flatlands below the grazing grounds to become subject to flooding. Williams concludes that for those privileged enough to gain access to bank credit, the beef export boom meant a quick way to expand their fortunes, while for those who planted for survival it spelled impending doom.1 of 1 people found the following review helpful. University of California anthropologist, Carol A. Smith, reviews Williams' workBy a readerUniversity of California anthropologist, Carol A. Smith, reviews Williams' work in the International Encyclopedia of the Social and Behavioral Sciences, "What took place in Central America calls for comparative research. The most useful and original comparisons have been done by Robert Williams, an economist who uses sociological, historical, and ethnographic methods in his research. Robert Williams's *Export Agriculture* (1986) observes that cotton and cattle production for export expanded hugely in all five countries and led to significant dispossession of peasants everywhere, including Costa Rica. But the five Central American states handled peasant protest quite differently, with both Costa Rica and Honduras carrying out land reform and expanding services while the three other states responded with repression and militarization-which led to war. In *States and Social Evolution* (1994), Williams examines the social and economic factors that led to two different kinds of states in Central America-the three revolutionary countries being controlled by rigid oligarchies, the other two being led by more open political groups. (Williams) finds an explanation in the social and political relations created by the coffee export economy, the first major post-colonial export in the region, which played a critical role in state formation."

Before social unrest shook the region in the 1970s, Central America experienced more than a decade of rapid export growth by adding cotton and beef to the traditional coffee and bananas. Williams shows how the rapid growth contributed to the present social and political crisis, examines the causes of the export boom and who benefited from it, and shows the impact of the boom on land use, the ecology, and the conditions of life in the rural areas.

"A highly effective presentation of what we currently know about coffee, society, and politics in Central America.Lowell Gudmundson, Mount Holyoke College"A highly effective presentation of what we currently know about coffee, society, and politics in Central America.Lowell Gudmundson, Mount Holyoke College The strength of this work lies in its ability to show the variability of social, labor, and land tenure patterns with coffee, not just between but within each of the Central American nations. . . . A highly effective presentation of what we currently know about coffee, society, and politics in Central America.--Lowell Gudmundson, Mount Holyoke CollegeAbout the AuthorRobert G. Williams, Voehringer Professor of Economics at Guilford College, is author of *Export Agriculture and the Crisis in Central America*.
